CoreWeave, Inc. (CRWV) — Credit Review

Aug 13, 2026 · Peter Deng

CoreWeave is a highly leveraged, capital-markets-dependent credit: it needs roughly $45bn of new financing through 2027 on top of $38bn of pro forma debt, and in our downside case FY27 EBITDA no longer covers interest (0.96x).

Capital structure

Pro forma debt is $37.95bn at 8/13/2026, 90% recourse to the parent and 56% secured on GPU fleets and customer contracts. The weighted average effective rate is 8.4% (~$3.2bn of annual interest).

Instrument	Principal ($mm)	% of total	Security	Rate	Final maturity
Delayed draw term loans (DDTL 1.0–5.5)	14,843	39%	Secured (GPUs, contracts)	Mostly SOFR + spread; eff. 7–15%	2028–2032, amortizing
Senior notes (USD and EUR)	10,029	26%	Unsecured	Fixed 8.5–9.75%	2030–2032, bullet
Convertible notes	6,588	17%	Unsecured	~2%	2031–2032, bullet
OEM and software vendor financing	5,102	13%	Secured	Not disclosed; eff. 9–11%	2026–2030
Revolving credit facility	1,200	3%	Secured	Floating; eff. 7%	Nov 2029
Magnetar loan	189	1%	Not disclosed	12% accretion	Jan 2029
Total	**37,951**	**100%**		**8.4% weighted**	

Non-recourse debt is $3.7bn (DDTL 4.0 and part of the OEM financing). Rate mix: 44% fixed, 35% floating, 7% mixed, 13% not disclosed. The new DDTL 5.5 is rated Ba2 (Moody's) and BB+ (Fitch) at the facility level, reflecting its collateral; the unsecured notes rank behind $21.1bn of secured debt.

Funding need

CoreWeave needs about $44.8bn of new financing from July 2026 to December 2027, roughly 1.2x its current debt, because planned capex of $57.9bn is nearly four times operating cash flow. The shortfall starts in 2H26: existing cash and committed facilities cover only 61% of 2H26 uses.

$mm	2H26	FY27	Total
Capex (company basis)	20,861	37,000	57,861
Scheduled debt maturities	4,413	6,184	10,597
Interest on existing debt and facility draws	1,712	3,391	5,102
Minimum cash balance	2,000	–	2,000
Total uses	**28,986**	**46,575**	**75,560**
Pro forma cash (8/13, excl. restricted)	7,939	–	7,939
Undrawn committed facilities (8/13)	9,829	–	9,829
Operating cash flow before interest	4,670	10,890	15,560
Total sources	**22,438**	**10,890**	**33,328**
Gap before interest on new debt	6,548	35,684	42,232
Interest on new debt (9.5%)	159	2,448	2,608
New financing required	**6,707**	**38,133**	**44,840**

Capex follows the company's FY26 guidance midpoint ($37bn) and is held flat in FY27. Operating cash flow is Adj. EBITDA at the 1H26 margin (57.3%) on guided 2H26 revenue and FY27 revenue held at the exiting-2026 ARR midpoint ($19bn), with no credit for customer prepayments.

Debt service capacity

Growth is bringing leverage down, but not coverage: depreciation absorbs about 90% of Adj. EBITDA, so operating income covers only 0.2x of interest on either basis.

	LTM to 6/30/26	Run-rate (Q2'26 x 4)
Revenue ($mm)	7,590	10,300
Adj. EBITDA ($mm)	4,400	6,040
Total debt / Adj. EBITDA	8.6x	6.3x
Net debt / Adj. EBITDA	6.8x	5.0x
Recourse debt / Adj. EBITDA	7.8x	5.7x
Adj. EBITDA / interest	2.35x	2.36x
Adj. operating income / interest	0.24x	0.20x

On pro forma interest for the 8/13 debt load ($3.2bn a year), run-rate coverage falls to 1.89x on Adj. EBITDA and 0.16x on Adj. operating income. Debt is pro forma at 8/13; earnings are company-reported non-GAAP.

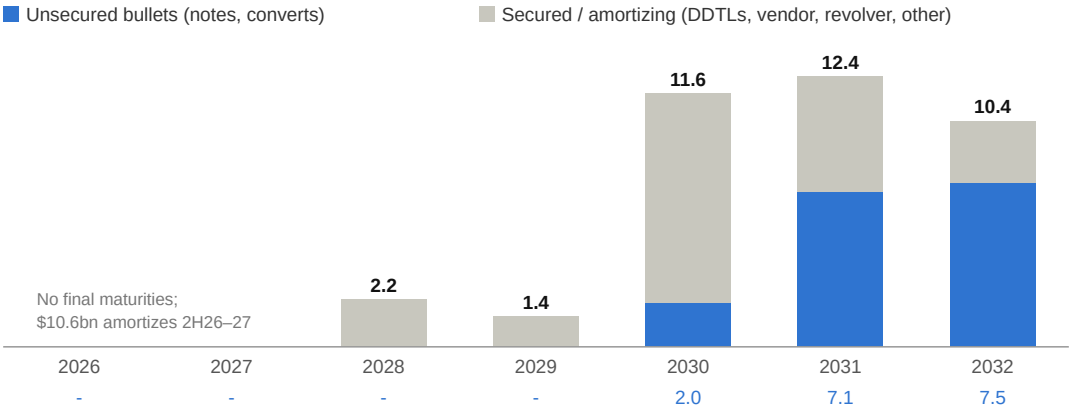

Liquidity of $17.8bn covers the next 12 months of debt service ($7.5bn principal plus $3.2bn interest) 1.66x. But $9.1bn of it is undrawn DDTL capacity that can only fund capex on specific contracts. Cash plus the revolver cover just 0.81x, so debt service also depends on operating cash flow and continued market access.

Maturity profile

Nothing reaches final maturity before 2028, but $34.4bn does in 2030–32, including $16.6bn of unsecured senior notes and converts that must be refinanced or converted.

Debt by final maturity, $bn: 2030–32 is the wall

$34.4bn matures in 2030–32, $16.6bn of it unsecured bullets to refinance or convert

Debt Database, pro forma 8/13/2026 (10-Q Q2'26 Note 10 and DDTL 5.5 8-K); amortizing debt shown at final maturity

Amortizing DDTLs and vendor financing are shown at final maturity, so their balances will be much lower by then. Scheduled principal including amortization is $4.4bn in 2H26 and $6.2bn in 2027, already counted in the funding need.

Downside scenarios

In the combined downside, FY27 Adj. EBITDA no longer covers interest (0.96x) and end-2027 leverage reaches 13x, while the financing need rises only $6.9bn. The stress hits debt service capacity far more than funding size, because capex is held at plan in every case.

FY27E	Base	A: GPU pricing	B: delays + pricing + rates
Adj. EBITDA margin	57.3%	45%	45%
Revenue vs plan	–	–	−10% 2H26, −20% FY27
SOFR shock / new debt rate	0bp / 9.5%	0bp / 11.0%	+100bp / 12.0%
New financing, 2H26–FY27 ($mm)	44,840	48,907	51,693
FY27 Adj. EBITDA ($mm)	10,890	8,550	6,840
FY27 total interest ($mm)	5,839	6,508	7,118
End-2027 debt ($mm)	82,023	86,090	88,876
Debt / FY27 Adj. EBITDA	7.5x	10.1x	13.0x
Adj. EBITDA / interest	1.87x	1.31x	0.96x

The base case is itself conservative: FY27 revenue gets no credit for the capacity that $37bn of FY27 capex adds, which overstates base-case leverage.

Risks, mitigants and what to monitor

The central risk is market access: the plan works only if CoreWeave keeps raising about $2.5bn of new debt a month.

Risk	Why it matters	Mitigant
Capital-markets dependence	$44.8bn of new financing through 2027, $6.7bn of it in 2H26	Raised ~$18bn in Q2'26 alone across debt, converts and equity; contract-backed DDTLs
GPU pricing and obsolescence	Margin to 45% takes FY27 leverage from 7.5x to 10.1x	$104.2bn revenue backlog fixes pricing for contract terms
Delivery delays (power, data centers)	Revenue slips while committed capex continues	4.2 GW of contracted power vs 1.5 GW active at Q2
Floating rates	35% of debt floats; +100bp costs ~$132m a year	DDTL 3.0 at least 75% swapped; notes are fixed
2030–32 refinancing wall	$16.6bn of unsecured bullets due in three years	$6.6bn are converts that may settle in equity; DDTLs amortize before maturity
Subordination	Unsecured notes rank behind $21.1bn of secured, mostly subsidiary-level debt	Contracts are underwritten to repay asset-level debt within their initial term, leaving unlevered GPUs (CFO, Q2'26 call)

What to monitor:

- DDTL 5.0 draw period ends 9/30/2026 with $2.0bn undrawn; unused commitments lapse.
- DDTL 5.5 debt service coverage covenant of at least 1.35x, tested from January 2027 at the latest.
- Quarterly capex against the Q3'26 guide of $11.5–13.5bn, and conversion of $11.9bn of construction in progress.
- New-issue pricing against the 9.5% assumed for new debt, and Adj. EBITDA margin against 57%.
- Interest expense against the Q3'26 guide of $860–940m.

Key assumptions and sources

All figures use information public on or before 8/13/2026: financials at 6/30/2026, debt pro forma for the DDTL 5.5 facility and the August revolver draw. Later events (September 2026 convertible notes, Q3 results) are excluded. The full list of 24 assumptions, with rationale and alternatives, is in the model's Assumptions Log.

- Debt is principal, not carrying value; interest uses 10-Q effective rates, with DDTL 5.5 assumed at 10%.
- Capex is on the company's definition (PP&E additions including finance leases, less change in construction in progress), not cash capex.
- Undrawn facilities are drawn evenly in 2H26; new debt costs 9.5%, is drawn evenly and is not repaid before 2028.
- A $2.0bn minimum cash balance is held; restricted cash ($1.4bn) is excluded.
